

LONG RANGE NIGHT VISION DEVICE
PDN-K, PDN-KM
Service Manual
AL3.803.115 RE

The design of the night vision sight is the subject of continuous improvement and can slightly differ from the present manual.

1 INTRODUCTION

The PDN-K and PDN-KM Long Range Night Vision Devices are designed for long range observation at natural night illumination, temperature from -50°C to $+50^{\circ}\text{C}$ (depends on type of battery used) and relative humidity up to 80% at temperature 25°C .

The Device is powered with two R6 GOST28125-89 power cells (AA size 14.5 x 50.5 mm) having aggregate voltage 3.0 V.

The adapter kit provides compatibility with a:

- video camera provided with lens thread M37x0.75;
- video camera $f=12.5$ mm provided with thread M40.5x0.5.

Attention! Do not switch on the device at daylight illumination without cap 1 (fig.3). Do not aim the device at bright luminous objects. Unused device on tripod should be protected by cover 4 (fig.3).

2 SPECIFICATIONS

| | PDN-K | PDN-KM |
|--|---------|--------|
| Angular resolution, arc. sec for ambient illumination $5 \cdot 10^{-3}$ lx | 50 | |
| Magnification, x | 9 | |
| Field of view, $^{\circ}$ | 3.83 | |
| Eyepiece adjustment range, d | ± 4 | |

| | | |
|-----------------------------------|---------|-----|
| Reticule scale division, mil | 5 | |
| Voltage, V | 3.0-0.5 | |
| Current consumption, mA, not less | 40 | |
| Azimuth angle range, ° | 360 | |
| Elevation angle range, ° | ±18 | ±45 |
| Weight, kg, not less | 12 | 13 |
| Weight with tripod, kg, not less | 25 | 20 |
| Package weight, kg, not less | 40 | 36 |

3 PACKAGE INVENTORY

4 SAFETY PRECAUTIONS

The Device is safe in design, used materials and components.

In order to avoid environmental pollution it is recommended to throw out the used power cells only in the places assigned for waste utilization.

5 DESIGN AND OPERATION PRINCIPLE

The Long Range Night Vision Device is an electro-optic device that intensifies a weak image up to visible level. The package of device includes the following:

- Device 1 (fig.1);
- tripod 11 (fig.2) with limb for PDN-K version;
- tripod 6 (fig.3) or pier 1 (fig.4) for PDN-KM version;
- cap 1 (fig.5) for protection of the objective lens from physical damages and excessive light in twilight conditions;
- soft cover 4 for protection of Device from straight sunlight and atmospheric precipitation;
- napkin 2 for cleaning of Device;
- case for Device;
- soft cover for tripod.

The device consists of the objective lens 4 (fig.1), eyepiece 11, image intensifier, mount bracket 6 (of dove tail type) in case of PDN-K version or fork mount 5 (fig.3) in case of PDN-KM version.

Field of view is provided with a reticule (fig.8).

The objective lens 4 (fig.1) can be covered with:

- the blend 5 preventing an irrelevant light influence in night conditions;
- the cap 1 (fig.5) preventing the lens from physical damages and excessive light in twilight conditions.

The rubber eyeshield 10 (fig.1) provides convenient viewing and protect the eye against injuries.

The Device is activated by turn of handwheel 2 having the following positions:

red dot – Device switched off;

white dot – Device switched on;

white dash – Device and reticule illumination switched on.

The battery compartment in bottom contains two R6 power cells under cover 7. The handwheel 8 adjusts focus of objective lens. The diopter ring 11 provides adjustment of eyepiece.

The tripod consists of table 5 (fig.2) with limb 11 and three telescopic legs 6. The protective cap 7 in PDN-K version covers the limb when the device is removed. The smaller cap in PDN-KM version for this purpose is attached to tripod.

The PDN-KM version is fixed in seat with the screw 1 (fig.3). The Device is aimed with the handles 4. Handwheels 2 and 3 lock the Device in horizontal and vertical planes correspondingly.

Rough horizontal aiming of limb version PDN-K is available at raised handle 3 (fig.2). The handwheel 4 provides fine horizontal aiming.

The handwheel 2 provides vertical aiming. Thumb-screw 8 locks the extended leg or pier in adjusted position. Height of position for PDN-KM version with pier 1 (fig.4) is adjustable also by means of handwheel 2.

6 OPERATION

The handwheel 2 (fig.1) of unused Device must be set into the position marked with a red dot.

The power cells must be placed in the case.

For using of the Device:

- remove the cover from the tripod;
- release the tripod legs from the strap;
- draw the legs 6 (fig.2) apart and adjust the height of tripod (top of the cap 7) to level of the shoulders;
- remove the cap 7 from the seat and hang it on the hook on one of the tripod legs;
- press the legs in ground in order to bring the bubble of level 10 in the center of smaller circle;
- set the Device in slot of limb 11 (fig.2) and secure with the handwheel 12;
- open the cover 7 (fig.1) of battery compartment and insert the power cells according to designated polarity;
- turn the handwheel 2 (fig.1) into position designated by white dot, eyepiece will shine with green;
- turn the handwheel 2 (fig.1) into position designated by white dot, the lighted crosshair will appear in the field of view ;
- turn the handwheel 2 to red dot to switch off the Device.

For using of video camera with M37x0.75 connection thread:

- remove the eyeshield 10 from the eyepiece;
- screw the adapter (fig.6) into thread M37x0.75 of video camera lens, rotating smaller ring;
- mount the video camera with adapter to the Device screwing the larger ring.

For using of video camera with M40.5x0.5 connection thread:

- remove the eyeshield 10 (fig.1) from the eyepiece;
- screw the adapter (fig.7) into M44x0.75 thread of the Device up to the stop;
- screw the video camera with lens on the M40.5x0.5 thread up to the stop;
- focus of the objective lens, video camera lens and eyepiece to have a sharp image.

7 MAINTENANCE

In service, prevent the Device and tripod table from moisture, dust and dirt. Outer surfaces of the lens and eyepiece must be clean.

The contacts of battery compartment must be free of corrosion.

Clean the optical surfaces with clean napkin or cotton wool wetted with mixture of alcohol and ether 1:10.

After using at moisture weather wipe the Device and tripod and dry them out. Keep the Device and tripod in a dry, heated room at temperature above 5°C far from heaters.

8 TROUBLESHOOTING

In the case of troubles, first check the following:

- if the polarity of power cells is proper;
- if the power cells are not discharged;
- if the lens and eyepiece are free of dust, dirt, oil, frost and moisture.

Special attention must be paid to clearness of contacts.

| Malfunction | Possible cause | Elimination |
|--|---|--|
| Screen of image intensifier does not shine or shines weak | Power cells are discharged or improperly installed | Replace the power cells. Ensure the correct polarity |
| Image is dim and blurred | Outer surfaces of lens or eyepiece are wetted or dirty | Clean the surfaces with napkin or cotton wool |
| Image brightness rises to maximum and falls down fast or fluctuates disturbing the goggles operation | Light overload | Close the objective lens with the cap 1 (fig.5) |
| A falcate darkening at the margin of view-field appears | The image intensifier has been overloaded by bright light sources | Switch off the Device. Close the objective lens by cap 1 (fig.5) for 30 min. |
| Image collapses | The image intensifier is overloaded by bright light sources | Switch off the Device. Close the objective lens by cap 1 (fig.5) for 30 min. |

If the mentioned methods do not eliminate a problem send the Device to a repair shop.

9 ACCEPTANCE CERTIFICATE

The PDN-K or PDN-KM Long Range Night Vision Device having serial №_____ meets the specifications and state standards and is accepted for service.
